## In the Claims

For the convenience of the Examiner, all pending claims are set forth below, whether or not an amendment is made. Please amend the claims as follows:

1. (Currently Amended) A method for detecting decryption of encrypted viral code in a subject file, comprising:

emulating computer executable code in a subject file;

maintaining a list of memory regions that have been read and then modified during the emulation;

flagging a memory area that is read during emulation of a first instruction in the computer executable code; and

detecting a modification to the flagged memory area during emulation of a second instruction in the computer executable eode code;

updating the list of memory regions to include the modified flagged memory area; and

triggering a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.

2. (Currently Amended) A method of detecting encrypted viral code in a subject file, comprising:

emulating computer executable code in a subject file;

maintaining a list of memory regions that have been read and then modified during the emulation;

determining whether a memory area is read during emulation of a first instruction in the computer executable code and whether the memory area is modified during emulation of a second instruction in the computer executable code;

updating the list of memory regions to include the modified memory area; and triggering a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.

3. (Original) The method of claim 2, wherein the emulation is performed on an instruction-by-instruction basis.

4. (Original) The method of claim 2, further comprising:

determining whether a selected one of the listed memory regions overlaps the modified memory area; and

updating the selected memory region to encompass the modified memory area.

5. (Original) The method of claim 2, further comprising:

determining whether a selected one of the listed memory regions is contiguous with the modified memory area; and

updating the selected memory region to encompass the modified memory area.

6. (Original) The method of claim 2, further comprising:

determining whether the modified memory area overlaps the listed memory regions; and

adding the modified memory area as a new memory region to the list of memory regions, if the modified memory area does not overlap any of the listed memory regions.

7. (Currently Amended) A program storage device readable by a machine, tangibly embodying a program of instructions executable by the machine to perform method steps for detecting decryption of encrypted viral code in a subject file, the method steps comprising:

emulating computer executable code in a subject file;

maintaining a list of memory regions that have been read and then modified during the emulation;

flagging a memory area that is read during emulation of a first instruction in the computer executable code; and

detecting a modification to the flagged memory area during emulation of a second instruction in the computer executable eode code;

updating the list of memory regions to include the modified flagged memory area; and

triggering a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.

8. (Currently Amended) A program storage device readable by a machine, tangibly embodying a program of instructions executable by the machine to perform method steps for detecting encrypted viral code in a subject file, the method steps comprising:

emulating computer executable code in a subject file;

maintaining a list of memory regions that have been read and then modified during the emulation;

determining whether a memory area is read during emulation of a first instruction in the computer executable code and whether the memory area is modified during emulation of a second instruction in the computer executable code;

updating the list of memory regions to include the modified memory area; and triggering a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.

9. (Currently Amended) A computer system, comprising:

a processor; and

a program storage device readable by the computer system, tangibly embodying a program of instructions executable by the processor to perform method steps for detecting decryption of encrypted viral code in a subject file, the method steps including

emulating computer executable code in a subject file;

maintaining a list of memory regions that have been read and then modified during the emulation;

flagging a memory area that is read during emulation of a first instruction in the computer executable code; and

detecting a modification to the flagged memory area during emulation of a second instruction in the computer executable eode code;

updating the list of memory regions to include the modified flagged memory area; and

triggering a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.

## 10. (Currently Amended) A computer system, comprising:

a processor; and

a program storage device readable by the computer system, tangibly embodying a program of instructions executable by the computer system to perform method steps for detecting encrypted viral code, the method steps including

emulating computer executable code in a subject file;

maintaining a list of memory regions that have been read and then modified during the emulation;

determining whether a memory area is read during emulation of a first instruction in the computer executable code and whether the memory area is modified during emulation of a second instruction in the computer executable code;

updating the list of memory regions to include the modified memory area; and triggering a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.

11. (Currently Amended) An apparatus for detecting decryption of encrypted viral code in a subject file, comprising:

a code emulator, wherein the code emulator emulates computer executable code in a subject file, and outputs memory access information corresponding to the emulated computer executable code; and

a memory monitor, wherein the memory monitor monitors the memory access information output by the code emulator, <u>maintains a list of memory regions that have been read and then modified during the emulation</u>, flags a memory area that is read during the emulation of a first instruction in the computer executable code, and detects a modification to the flagged memory area during emulation of a second instruction in the computer executable code code, updates the list of memory regions to include the modified flagged memory area, and triggers a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.

12. (Currently Amended) An apparatus for detecting encrypted viral code in a subject file, comprising:

a code emulator, wherein the code emulator emulates computer executable code in a subject file, and outputs memory access information corresponding to the emulated computer executable code; and

a memory monitor, wherein the memory monitor monitors the memory access information output by the code emulator, maintains a list of memory regions that have been read and modified during emulation, determines whether a memory area is read during emulation of a first instruction in the computer executable code and whether the memory area is modified during emulation of a second instruction in the computer executable code, updates the list of memory regions to include the modified memory area, and triggers a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.

- 13. (Original) The apparatus of claim 12, wherein the code emulator performs the emulation on an instruction-by-instruction basis.
- 14. (Original) The apparatus of claim 12, wherein the memory monitor determines whether a selected one of the listed memory regions overlaps the modified memory area, and updates the selected memory region to encompass the modified memory area.
- 15. (Original) The apparatus of claim 12, wherein the memory monitor determines whether a selected one of the listed memory regions is contiguous with the modified memory area, and updates the selected memory region to encompass the modified memory area.
- 16. (Original) The apparatus of claim 12, wherein the memory monitor determines whether the modified memory area does not overlap the listed memory regions, and adds the modified memory area as a new memory region to the list of memory regions.

- 17. (Currently Amended) A computer data signal embodied in a transmission medium which embodies instructions executable by a computer for detecting decryption of encrypted viral code in a subject file, comprising:
- a first segment, including emulator code, wherein the emulator code emulates computer executable code in a subject file, and outputs memory access information corresponding to the emulated computer executable code; and
- a second segment including memory monitor code, wherein the memory monitor code monitors the memory access information output by the code emulator, maintains a list of memory regions that have been read and then modified during the emulation, flags a memory area that is read during the emulation of a first instruction in the computer executable code, and detects a modification to the flagged memory area during emulation of a second instruction in the computer executable eode code, updates the list of memory regions to include the modified flagged memory area, and triggers a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.
- 18. (Currently Amended) A computer data signal embodied in a transmission medium which embodies instructions executable by a computer for detecting encrypted viral code in a subject file, comprising:
- a first segment including emulator code, wherein the emulator code emulates computer executable code in a subject file, and outputs memory access information corresponding to the emulated computer executable code; and
- a second segment including memory monitor code, wherein the memory monitor code monitors the memory access information output by the code emulator, maintains a list of memory regions that have been read and modified during emulation, determines whether a memory area is read during emulation of a first instruction in the computer executable code and whether the memory area is modified during emulation of a second instruction in the computer executable code, updates the list of memory regions to include the modified memory area, and triggers a viral detection alarm, if one of the listed memory regions is larger than a predetermined size, the viral detection alarm indicating detection of viral code.
